General to TURBOVAC Pumps

Turbomolecular vacuum pumps (TURBOVAC) are used in applications which require a clean high or ultrahigh vacuum like, for example, in research, development or in industrial fields like the semiconductor industry, analytical instrumentation or coating technology.

Principle of Operation

In principle, the turbomolecular pump is a turbine rapidly revolving in a housing where the rotor stages of the turbine

are equipped with a number of rotor blades. Located between the rotating rotor blades are stationary stator disks with blades arranged in the opposite direction. By means of a momentum transfer from the rotating rotor blades to the gas molecules their initially non-directional thermal motion is changed in to a directional motion from the inlet flange of the pump in the axial direction towards the forevacuum flange. In the molecular flow range (i.e. at pressures below 10^{-3} mbar (0.75×10^{-3} Torr)) the mean free path of the gas molecules is

larger than the spacing between the rotor and the stator blades (typically a few tenths of a millimetre). Correspondingly the molecules chiefly collide with the optically dense rotor blades, resulting in a highly efficient pumping action. In the laminar flow range (i.e. at pressures over 10^{-1} mbar (0.75×10^{-1} Torr)) the effect of the rotor is impaired by frequent collisions between molecules themselves. For this reason, a turbomolecular pump is not capable of pumping gases at atmospheric pressure.

Sectional drawing of a turbomolecular pump (TURBOVAC i)

Rotor Bearing

Leybold offers different rotor bearing systems. A purely classic mechanical type of rotor bearing (TURBOVAC) or a magnetic rotor bearing (TURBOVAC MAG) and also

a hybrid bearing (TURBOVAC i / iX) where the bearing on the forevacuum side is a ceramic ball bearing lubricated for life and where the bearing on the high vacuum side is implemented by way of a non-wearing magnetic bear

ing. Typical for all these types of bearing is that they do not require any lubricating oil which under circumstances like standstill of the pump might diffuse back into the vacuum chamber due to the lack of any pumping action.

Drive Electronics/Control Unit

Driving and monitoring the turbomolecular pump requires an electronic frequency converter (inverter). The frequency converter delivers the driving voltage and the output frequency for the motor and also automatically monitors the system. Optimum running up of the pump rotor is attained by a steadily increasing voltage and frequency feed. After attaining the nominal speed, the start-up current is reduced in a controlled manner to the level necessary for normal operation.

The frequency converter and the motor of the TURBOVAC have been designed for a minimal drop of speed even at high intake pressures. This ensures the highest possible gas throughput also in the transition range from molecular to viscous flow

Depending on the given system and installation conditions, the control unit may be supplemented by a comprehensive range of optional accessories facilitating easy integration within existing installations.

Forevacuum Pump

Since turbomolecular pumps are not capable of compressing directly against atmospheric pressure their operation will always require a sufficiently rated forevacuum pump. For the classic rotor arrangement with rotor blades, generally two-stage rotary vane pumps (TRIVAC) will be suitable. In some cases also single-stage rotary vane vacuum pumps (SOGEVAC BI) or dry compressing vacuum pumps (SCROLLVAC plus, ECODRY plus) can be chosen. In the case of the wide range variant where the rotor is equipped with an additional compression stage (compound stage) also diaphragm vacuum pumps (DIVAC) may be used.

Characteristic Quantities

Pumping speed (volume flow rate)

The pumping speed "S" is the conveyed volume flow through the intake opening of the pump. It is dependent on the type of gas so that for this reason the nominal pumping speed, i.e. the maximum attainable pumping speed of the pump is commonly stated for air, respectively nitrogen. In the field of high vacuum engineering it is common to state the pumping speed in the unit of measurement [l/s]. The pumping speed is a nonlinear function of the inlet pressure $S = S(p_i)$.

Gas throughput

Gas throughput "Q", unit of measurement [mbar x l/s] is linked to the pumping speed through the inlet pressure.
 $Q = Q(p_i) = p_i \times S(p_i)$.

Compression

Compression "K" is defined as the ratio between the pressure on the forevacuum side of the turbomolecular pump and the pressure on the high vacuum side.
 $K = K(p_{VV}) = p_{VV}/p_{HV}$
 Compression is dependent on the type of gas.

Ultimate pressure (base pressure)

The ultimate pressure " p_{ult} " of a turbomolecular pump which can be baked out is defined through the ratio between forevacuum pressure and compression ratio which is attained in a test chamber 48 hours after a 24-hour bake-out (degassing) of the measurement arrangement.
 $p_{ult} = p_{FV}/K_0$.

The maximum attainable ultimate pressure depends among other things on the cleanliness of the apparatus, the type of forevacuum pump used, the types of seals used for the high vacuum flange and the bake-out conditions.

TURBOVAC Product Line

The TURBOVAC pumps are turbomolecular pumps with mechanical rotor suspension which are used in the pressure range from 10^{-1} mbar (0.75×10^{-1} Torr) to 10^{-10} mbar (0.75×10^{-10} Torr). Pumping speeds for air vary from 35 l/s (inlet flange diameter = 40 mm (1.57 in.)) to 925 l/s (inlet flange diameter = 200 mm (7.87 in.)).

Besides a variant with extremely reliable ceramic ball bearings on the forevacuum and the high vacuum side, Leybold also offers a line of turbomolecular pumps equipped with hybrid bearings which on the forevacuum side are equipped with a ceramic ball bearing and on the high vacuum side with a permanent magnetic bearing (TURBOVAC i line).

Owing to their compact design and ease of operation, these pump lines are

used in all high vacuum and ultrahigh vacuum fields of application. In particular, the TURBOVAC pumps are running very successfully in mass spectrometers, in CD, DVD and hard disk production units, in the manufacture of large area optical coatings, in non-corrosive semiconductor production processes and in laboratories as well as research institutes.

The most important advantages of the TURBOVAC product line are:

- Stress free operation with a proven robust design
- Unrivalled performance with speeds up to 60% above reference products
- Minimum application impact, low vibration and oil free operation
- Flexible customizable product with multiple control options
- The Leybold Promise - the right product for you backed by the Leybold Experts

TURBOVAC 350 iX

TURBOVAC MAG Product Line

The TURBOVAC MAG pumps are turbomolecular pumps with magnetic rotor suspension which are used in the pressure range from 10^{-1} mbar (0.75×10^{-1} Torr) to 10^{-10} mbar (0.75×10^{-10} Torr). Pumping speeds for air vary from 300 l/s (inlet flange diameter = 100 mm (3.94 in.)) to 2,200 l/s (inlet flange diameter = 250 mm (12.6 in.)).

The TURBOVAC MAG pumps are mostly installed in areas that require noise-free and vibration-free operation, have to be free of hydrocarbons and require long maintenance intervals. Electron beam microscopy, analytical technology, R & D as well as large area & flat panel display coating are important areas of application for these pumps.

The most important advantages of the TURBOVAC MAG product line are:

- Hydrocarbon-free pumps for the generation of clean high and ultra-high vacuum conditions
- High performance in any orientation
- High degree of operating reliability
- Extremely low vibration
- Almost maintenance-free

TURBOVAC MAG 2200 iPL

Use of Turbomolecular Pumps in Analytical Instruments

All modern analytical methods for gas, liquid and plasma analysis – like for example GC-MS, LC-MS and ICP-MS – rely on mass spectrometers and for this reason require adequate high vacuum conditions. Also in electron microscopes and many surface analysis instruments the production of a high vacuum is essential. In over 90% of all high vacuum applications, the turbomolecular pump has been found to be ideal. Thanks to the hydrocarbon-free vacuum, compact design, very simple and almost maintenance-free operation it has often displaced above all the diffusion pumps.

On the basis of decades of experience and in cooperation with research facilities and the manufacturers of analytical instruments, Leybold has continually optimized its products.

TURBOVAC 950 i

Through the TURBOVAC wide range series, a further improvement has been attained, making available to users in the area of analytical engineering highly flexible and reliable products.

Owing to the modular concept the user may adapt the vacuum system precisely to his requirements. The components can be integrated perfectly and thus find the most cost-effective system configuration. Through the introduction of the TURBOVAC multi inlet series, Leybold has, based on special customer requirements, achieved a major step ahead for analytical instruments.

Two or more analysis chambers can be pumped down simultaneously by a single multi-inlet pump. These pumps have been tailored for pumping speed and gas throughput in order to attain a higher detection sensitivity of analytical systems, for a smaller footprint and an increased sample throughput, for example. The benefits for the customers are the extreme compactness of the vacuum systems without sacrificing performance density, simple installation, stable vacuum connections and, compared to the use of discrete individual pumps, significantly lower investment costs for the entire system. The cartridge solution, moreover, allows for an innovative and cost-effective design of the customer's system and during servicing a simple replacement of the active unit without involved assembly work and leak searching.

Cartridge benefits, which convince with:

- Higher effective pumping speed
- No losses in conductance
- Compact vacuum system
- Easy pump replacement without having to disassemble the highly sensitive mass spectrometer chambers

The benefits for the customers are reflected by the efficiency of the analytical instruments:

- Increase in detection sensitivity
- Smaller analytical systems
- Increase in sample throughput
- Reduction of system costs
- Lower maintenance costs

In combination with backing pumps like the SOGEVAC, TRIVAC, ECODRY plus or SCROLLVAC plus, Leybold is able to offer the best vacuum system optimized for all major applications in the area of analytical instrumentation.

TURBOVAC i Multi Inlet

Use of Turbomolecular Pumps in the Area of Coating Systems or other Industrial Applications

Many coating processes like large area coating, wear protection or decorative coating as well as industrial installations like furnaces require high vacuum conditions. This is the only way to ensure that the formed layers will be uniform and adhere to the substrate, or process chambers are clean enough to guarantee a good product quality..

By pumping the vacuum chamber down to pressures in the range of 10^{-6} mbar (0.75×10^{-6} Torr), interfering gas and water molecules are removed from the process chamber. The process pressure of coating applications depends on the kind of process: e.g. sputtering uses pressure

ranges of 10^{-3} mbar (Torr), in evaporation processes pressures between 10^{-4} and 10^{-5} mbar (Torr) are needed.

The turbomolecular pump meets all requirements of the customers as to a hydrocarbon-free vacuum, very simple operation, compact and robust design and nearly maintenance-free operation in an almost ideal manner. The range of pumps from Leybold includes pumps with flange diameters ranging from 40 mm to 250 mm (1.57 in. to 9.84 in.) nominal width.

Thus the right pump is available for each application.

Coating of architectural glass

Use of turbomolecular pumps in research and development

In many applications in which new ideas shall be transformed into technical processes, vacuum technology is a basic requirement for being able to implement these processes at all.

Turbomolecular pumps from Leybold are being used widely in the research and development field. Since the application requirements differ widely, for

example between university basic research, industrial development, research and large laboratories, the right component or the vacuum system can be selected from the comprehensive range of equipment being offered.

General Information about TURBOVAC i / iX Pumps

Turbomolecular Pumps with Hybrid Rotor Suspension (mechanical/magnetic)

TURBOVAC i / iX

The TURBOVAC i / iX series is a modular line of turbomolecular vacuum pumps. With the integrated drive electronics (frequency converter) it forms a single unit.

In the development of the TURBOVAC i / iX special emphasis was placed on the maximum attainable pump performance in consideration of its footprint. The specially developed rotor/stator design guarantees excellent performance data as to pumping speed, gas throughput and compression also for light gases.

In all pumps of this line, the bearing consists of a non-wearing permanent magnetic bearing on the high vacuum side and an oil-free ceramic ball bearing with lifetime-lubrication on the forevacuum side. For this reason, the usually required standard maintenance involving an oil change is no longer necessary. The ceramic ball bearing is replaceable on-site, should this be required.

The pumps are equipped as standard with a venting and purge gas port for directly connecting a venting valve, purge gas valve or purge gas throttle to the pump.

Owing to the many possible combinations (electronics, pump stage design, housing and the range of accessories) the TURBOVAC i / iX can be flexibly adapted to the specific application in almost all cases.

For example, in comparison with the TURBOVAC i, the TURBOVAC iX is equipped with an integrated vacuum system control unit which drives accessory components like vacuum gauges, valves, fans and forevacuum pumps. Moreover, numerous optionally available communication interfaces facilitate easy integration within your installation. The pump stage design (rotor, stator and Holweck stage) can be selected specifically in consideration of the respective process requirements and offers variants for highest possible gas throughput, pumping speed and/or compression in single or multi-chamber systems. Equally comprehensive is the range of housing and flange variants being offered where the vacuum connections can be adapted flexibly to the on-site installation conditions. The wide range of accessories completes the TURBOVAC i / iX line thereby extending the fields of application for these pumps.

Advantages for the User

- High pumping performance from a compact size
- Cost-effective price-to-performance ratio
- Highly reliable, maintenance-free bearing concept without oil lubrication
- Owing to the overall modular concept, individually adaptable to the respective conditions and requirements
- Variety of housings and flange options
- Easy and easily adaptable installation, any mounting position
- Easy process integration due to the numerous interfacing options
- Flexible accessory options (power supply, cooling, heating, venting, installation etc.)

Overview of Variants

Electronics Variants

All pumps are equipped with integrated drive electronics with a 24 V/48 V or 48 V power supply which controls the amount of drive power and which monitors all pump functions.

The individual requirements with regard to communication interfaces and the functional scope of the driving options for accessory components can be covered through a number of different electronics variants.

Left: **TURBOVAC i** with standard interface

Centre: **TURBOVAC i** with Anybus interface extension

Right: **TURBOVAC iX** with integrated vacuum system control unit and Anybus interface extension

Electronics Variants

TURBOVAC i (Standard)

Cost-effective solution equipped with basic functions and interfaces.

- Internal 24/48 V DC or 48 V frequency converter
- Status LEDs
- Accessory connection for up to 2 controllable accessory components
- User-friendly interfaces (USB, RS 485, 15-pin digital I/O)

Standard interface USB, RS 485 and 15-pin digital I/O for TURBOVAC i

TURBOVAC i

(Anybus interface extension)

Features like TURBOVAC i, additionally:

- User-friendly interfaces (USB, 15-pin digital I/O) and Anybus interface instead of the RS 485 for further interface options: RS 232, Profibus, ProfiNET, EtherCAT and Ethernet/IP (further interfaces upon request)
- TURBOVAC 850 i and 950 i also available as IP 54 versions

Anybus interface expansion for TURBOVAC i

TURBOVAC iX

(Vacuum system control unit)

With integrated vacuum system control unit and Anybus interface extension.

Features like TURBOVAC i (Anybus interface extension), additionally:

- 3 outputs for controlling vacuum pump accessories
- 1 vacuum gauge head connection for powering and data recording of vacuum gauge heads and application of pressure data for pump system control
- Flexibly programmable software, for customising the configuration of the control connections

Integrated vacuum system control unit of the TURBOVAC iX

Performance Variants

TURBOVAC i / iX

The standard variant for HV / UHV applications and compact pump system solutions. Owing to the additional Holweck compression stage it delivers high pumping speed and high compression especially for light gases, and due to its high forevacuum tolerance it is suited for operation in combination with diaphragm or scroll forevacuum pumps.

TURBOVAC i Multi-Inlet

The variant with a special rotor design and two or more inlets as an efficient and compact vacuum solution for multi-chamber systems. It allows a high degree of system integration and convinces compared to systems with single turbomolecular pumps through its lower weight and smaller footprint. Furthermore the multi-inlet versions offer an increased reliability of the entire vacuum system through the reliance on fewer components compared to similar systems equipped with single turbomolecular pumps.

Housing and Flange Variants

The optimised rotor geometry has been specially adapted to the industrial standard sizes for maximum pump performance. Housings with ISO-K as well as CF flanges are available. Moreover, the standard housings with an additional inlet stage are available upon request.

Multiple inlet stages can be implemented through the **TURBOVAC Multi-Inlet**. Here in addition to the special cartridge solution which facilitates easy replacement in the field, also custom housing and chamber solutions are offered for utmost system integration.

Flexibility

The forevacuum connection for the pump sizes TURBOVAC 90 i / iX - TURBOVAC 450 i / iX is rotatable thereby facilitating flexible installation within existing systems making optimum use of the available space. Moreover, the required amount of installation space may be reduced by a detachable cable connected interface module

Left: TURBOVAC i with radial forevacuum flange
Right: TURBOVAC i with axial forevacuum flange

Accessories for TURBOVAC i / iX

Power Supply

TURBO.POWER integra

- Plug-and-play power supply for fitting underneath the pump, 100-240 V
- for TURBOVAC 90 - 450 i / iX only
- Including short connecting cable to the pump
- Also for benchtop placement (TURBOVAC 90 - 450) with optional extension cable (1, 3, 5 m (3.5, 10.5, 17.5 ft))
- Requires a country-specific mains cord (EU, US, UK ...)

Power Supply

TURBO.POWER 800

- Plug-and-play power supply for fitting to the side of the pump, 100-240 V
- for TURBOVAC 850 / 950 i / iX only

24VDC Display Unit

TURBO.CONTROL i

- Control and monitoring of a TURBOVAC i / iX pump
- The 24 V/DC operating voltage comes from a plug power supply with round plug (24 V/DC - 1.5A - 36W)
- Can be installed in a rack or mounted in a table housing

- Has two communication channels (RS485 & USB) to the pump control and two interfaces for gauges. An ethernet provides the possibility of running a web server for the pump control and monitoring on an external PC and to read logged data via the TURBO.CONTROL i.
- Requires a plug-in power supply and standard cable for communication
- The following measuring gauges can be attached:
PTR90, PTR90N, TTR91R, TTR91N, TTR101

Pump control unit with Power Supply TURBO.CONTROL 300 for TURBOVAC 90 - 450 i / iX

- Control unit and power supply for rack installation
- With on/off switch for the turbo-molecular pump
- Status LEDs and status relays for monitoring the pump
- For remote control via interface
- Requires a connection cable to the pump (1, 3, 5 m (3.5, 10.5, 17.5 ft)) and country-specific mains cord (EU, US, UK ...)

Connecting cables to the pump with bare wire ends of for customer specific power supply units

Relay Box

The relay box allows you to control via the 24 V DC output on the TURBOVAC i a mains powered electric consumer, like a backing pump, for example. Mains power and consumer are connected using mains power cords, the control voltage is connected through an M 8 connector.

- incl. connection cable with a M 8 plug, 2 m (7.0 ft) long

DC pump plug for TURBOVAC 90 - 450 i
for adapting the supply voltage by the customer.

- 24/48 V DC-In plug TURBOVAC i

Radial air cooler

for lateral installation on the pump, including connection plug

- Flexible positioning

Axial air cooler for TURBOVAC 90 - 450 i
For installation underneath the pump, including connection plug

Water cooling

for flexible installation on the pump (required for degassing the turbomolecular pump)

Heating Collar

for degassing the pump

- Degassing temperature 100 °C (212 °F)
- Requires a country-specific mains cord (EU, US, UK ...)
- With optional relay box and accessory cable, automatic control via the electronics of the TURBOVAC i / iX is possible

Accessory Valves

- Power supply 24 V DC
- G 1/8" inlet (inside thread) and discharge (outside thread) connection
- Including O-ring and connecting cable with M 8 plug for connection to the accessory input on the TURBOVAC i / iX

Purge Gas Valve (for connection to the purge gas connection on the turbomolecular pump)

for controlling the admitted purge gas quantity

- The valve is closed when no power

Venting Valve (for connection the venting connection)

for venting the turbomolecular pump

- The valve is normally closed

Power Failure Venting Valve (for connection the venting connection)

for venting the turbomolecular pump

- The valve is normally open

Purge Gas Throttle

for passively controlling the admitted purge gas quantity

- G 1/8" inlet (inside thread) and discharge (outside thread) connection
- Purge gas throttle 24 sccm

Air Filter

for connection to the valves or throttles

- Prevents contamination and clogging of valves and throttles
- G1/8"

Y-Splitter

- Extends the M 8 accessory connection on the TURBOVAC i by a further connection for parallel driving of two accessory components. Here both accessory components are switched synchronously

Installation and Mounting Accessories

Mounting kit for safe mounting of the pump

The mounting kits include:

ISO-K kit (63, 100, 160 and 200):
centering rings and clamps

ISO-F kit (63, 100, 160 and 200):
collar flange, outside ring, bolts and nuts

CF kit (63, 100, 160 and 200):
2 copper gaskets, bolts, nuts and washers

Mounting kits (left ISO-KF, centre ISO-F, right CF)

Centering Rings with Splinter Guard (DN 63, 100, 160 and 200 ISO-K/F)

Centering Rings with Inlet Screens (DN 63, 100, 160 and 200 ISO-K/F)

Splinter Guards (DN 63, 100, 160 and 200 CF)

Inlet Screens (DN 63, 100, 160 and 200 CF)

for protecting the pump against
ingesting parts.

Inlet screen, 3.2 mm (0.01 ft) mesh
Splinter guard, 0.8 mm (0.003 ft) mesh

Note:

For ISO-K/F, both inlet screen and
splinter guard have been integrated in
the centering ring.

Vibration Absorber (DN 100/160 ISO-K and 100/160 CF)

Prevents any possible vibration transfer
from the pump to sensitive instrumen-
tation or apparatus.

Software LEYASSIST *

Software platform developed to intuitively control, configure, monitor Leybold vacuum products and intelligent systems through USB or serial RS232 / RS485 to USB interfaces. We are continuously developing LeyAssist to respond to our customer needs and to expand the support of the full range of intelligent Leybold products over time.

Functionality:

- Auto connect to Leybold Vacuum products
- Configure and control products
- Checking alarm warning status and doing trouble shooting
- Easy configuration of intelligent pump systems around local Hub products such as TURBOVAC i / iX
- Enabling Plug & Play

* available as free download from our website

Products

TURBOVAC
with Hybrid Rotor Suspension (mag/mech)

with integrated Frequency Converter

TURBOVAC 90 i, 250 i, 350 i, 450 i, 850 i and 950 i

TURBOVAC i family

with integrated Frequency Converter and
integrated Vacuum System Controller

TURBOVAC 90 iX, 250 iX, 350 iX, 450 iX, 850 iX
and 950 iX

TURBOVAC iX family

Typical Applications

- Analytical technologies / Research & Development
 - Mass spectrometers
 - Electron microscopes
 - Surface analysis
 - X-ray-analysis
 - Particle accelerators and synchrotrons
 - Laboratory coating systems
 - MBE (Molecular Beam Epitaxy)
 - UHV systems
- Life Sciences
 - Proton therapy
 - Gamma sterilisation
 - Production of high quality implants
- Industrial and Coating applications
 - PVD- Physical Vapour deposition
 - Optical coatings
 - CD/DVD/Blu-Ray Disc production
 - Thin film technologies, photovoltaics
 - Wear protection
 - Heat treatment
 - Electron beam welders
- Load locks, transfer chambers, handling systems
- Insulation vacuum and leak detection

Technical Features

TURBOVAC i

- Integrated electronic drive unit with 24/48 V DC supply
- Best in class pumping speed and compression ratio especially for light gases
- Vacuum port design flexibility
- Installation in any orientation
- Superior reliability due to innovative pump and bearing design
- Maintenance free hybrid mechanical TMP
 - no need for oil changes
- On-site maintenance possibility (bearing exchange) to reduce service costs and time
- Widest range of interface options (USB, RS 485 and 15 pin digital I/O as standard)
- Optimized size/performance ratio on 63, 100, 160 and 200 flanges
- Flexible accessory program options for easy plug & play
- Flexibility to match different process and application requirements

TURBOVAC iX

- Same features like TURBOVAC i
- Integrated vacuum system controller with flexible interfaces and several accessory ports for control of cooling units, valves, gauges, fore-vacuum pumps etc.

Advantages for the User

TURBOVAC i

- Best performance and functionality for your money
- Maximum user flexibility for easy system integration, operation and control
- Highest productivity and system uptime at lowest CoO (Cost of Ownership)
- Improved pump-down time and target pressures
- Superior pumping performance for light gases
- Down-sizing of vacuum system in terms of costs and dimensions (use of small forevacuum pumps)

TURBOVAC iX

- Same advantages like TURBOVAC i
- Easy plug & play pump system control
- Avoid extra costs for separate pump system control units and cabling

Special Turbomolecular Pumps

TURBOVAC i Multi Inlet Cartridge

Precision is key when it comes to analytical instruments.

Outfitted with two or more inlets, the innovative turbopumps with integrated drive electronics provide extraordinary pumping performance and are adaptable to the system requirements of each instrument.

In combination with our support for the whole vacuum system design, it will result in the best possible level of pump system integration you have ever experienced.

For example the TURBOVAC 350-400 i Multi Inlet line has been especially developed to meet the requirements of analytical instruments and features an extremely high level of flexibility, allowing you to choose the number, height and position of the multiple vacuum ports. The result: a pump that is perfectly fitted to your specific performance needs and installation requirements.

Additionally, we offer the support and experience in vacuum system design which opens a wide range of possibilities, from the adaptation of the pump housing to your vacuum chamber through to the design of a custom-built housing/chamber that meets your particular needs. Your benefit: optimum system integration of the pump(s) into your instrument and a reduced time to market.

Your Advantage

- Perfect integration of the pump(s) within your instrumentation
- Cutting of system costs
- Smaller size of the analytical system
- Reduction in the number of individual vacuum components
- Choice between cartridge and custom pump housing

In order to simplify installation, operation and control, all TURBOVAC i variants feature an integrated electronic drive with 24/48 V DC supply and a detachable operator interface with USB, RS 485 and digital I/O connections.

Performance

- Industry-leading pumping speed especially for light gases (up to 60 % higher than existing products)
- Optimized rotor diameter to provide maximum pumping performance
- > 40 l/s pumping speed at Inter-stage port 2

Flexibility

- Vacuum port design flexibility
 - Rotatable fore-vacuum port
 - Multiple interstage ports
 - High level of flexibility in terms of height and position of vacuum ports
- Unique cartridge solutions for optimized system integration with fast and simple field replacement
- Special pump housing solutions adapted to your instrument
- Complete vacuum system design including your vacuum chamber
- Variable rotor and Holweck design to adapt the performance to your application

Installation, operation and control

- Integrated 24/48 V DC drive electronics to avoid expensive cabling
- Widest range of communication interfaces: USB, RS 485 and remote 15 pin digital I/O as standard options
- Highly efficient motor
- Thermal isolation by design for optimized cooling of bearing and improved pump lifetime
- Simply-supported shaft reduces vibration
- Maintenance free upper passive magnetic bearing
- Oil free, lifetime lubricated lower mechanical ceramic ball bearing, field-replaceable

Outstanding performance

Thanks to its variable rotor and drag stage design, our new Multi Inlet product line provides the highest performance for all mass spectrometer applications. With increased pumping speed levels especially for light gases which are up to 60% higher than those

offered by other products currently on the market, it provides significant advantages for your instruments: lower pressures, improved detection sensitivity levels and higher sample throughput rates.

Superior reliability

The unique maintenance and oil free hybrid bearing system is characterized by its extreme reliability and durability – that's because we equipped it with an innovative lifetime lubrication system that never needs an oil change. The simply-supported shaft system results in a low vibration pump design which reduces noise, mechanical stress and negative impact on vibration sensitive applications. Optimized cool-

ing of the bearings is ensured through thermal isolation and the highly efficient motor. To protect the bearings from critical gases or particles, all pumps are equipped with a purge port. As a consequence, not only pump lifetime is increased significantly, but also system uptime as well as productivity. In combination with low costs of ownership, the operation of your vacuum system will be more efficient than ever.

Advantages to the User

- High gas throughput
- High effective pumping speed
- High efficiency for analytical instruments
- High detection sensitivity
- High sample throughput
- Free of hydrocarbons
- Hybrid bearing suspension for low vibration levels
- Space and weight saving
- Low component count
- Favourable price-to-performance ratio
- Installation and user friendly
- Practically maintenance free

Typical Applications

For example

- LC-MS (linking of a liquid chromatograph to a mass spectrometer)
- GC/MS (linking of a gas chromatograph to a mass spectrometer)
- TOF-MS (time-of-flight mass spectrometer)
- ICP-MS (inductively coupled plasma mass spectrometry)
- Helium leak detectors

Technical Features for this example

- Dual Inlet (pumping down of two analysis chambers)
- Triple inlet (pumping down of three analysis chambers)
- High effective pumping speed

HV stage	up to 400 l/s
Interstage IS 1	up to 300 l/s
Interstage IS 2	up to 50 l/s
- Cartridge solutions (without pump housing) are available
- Compact vacuum system

Customized versions are available upon request

Mechanical Rotor Suspension with Frequency Converter for Attaching or Separate with or without Compound Stage

TURBOVAC SL 80 / SL 80 H / SL 80 C

Typical Applications

- Mass spectrometers specifically suitable for portable mass spec applications (e.g. suitcase, gas chromatography (GC-MS), liquid chromatography (LC-MS), residual gas analysis, mobile analytical systems, etc.)
- Helium leak detectors
- Electron beam microscopy
- XHV-/UHV systems
- Transfer chambers

Technical Features

- Excellent resistance against vibration and external mechanical shocks - unique mature double mechanical bearing
- Flexible attachment of the frequency converter to the pump
- Small footprint
- Oil-free pump
- High pressure foreline tolerance
- Efficient convection cooling due to a large number of cooling fins
- Purge gas/venting connection
- Installation in any orientation
- Selection of interfaces, USB, RS 232 C, RS 485 C, Profibus

Dimensional drawing for the TURBOVAC SL 80: attachment examples

Pumping speed as a function of the inlet pressure

Advantages to the User

- Easy to integrate into complex vacuum systems, especially when space is limited
- Space-saving
- Prepared for pumping of slightly corrosive gases owing to the seal gas connection
- High reliability, MTTF over 200,000 hours
- Matching accessories (fan, water cooling, seal gas/venting valves, power failure venting valves, flange heaters, different cable lengths etc.)

MAG INTEGRA – Magnetic Rotor Suspension with integrated Frequency Converter, with Compound Stage

TURBOVAC MAG W 300/400 iP

Typical Applications

- Gas analysis systems
- Particle accelerators
- Electron microscopes
- Research
- Coating systems

Technical Features

- Installation in any orientation
- DN 100 or 160 ISO-K and/or CF high vacuum connection
- DN 16 ISO-KF with clamped fore vacuum connection
- Purge gas/venting connection DN 16 ISO-KF with clamped connection (purge/vent)
- Water or air cooling optional
- 2 slots for industrial communications modules
- Standard 9 pin 24 V SPS PLC-IO in Control Slot
- RS 232 C in Service Slot
- further interfaces can be fitted: Profibus, RS 485 C, DeviceNet, EtherNet IP, EtherCat, ProfiNet

Dimensional drawing for the TURBOVAC MAG W 300/400 iP

Pumping speed for N_2 of the TURBOVAC MAG W 300/400 iP as a function of the inlet pressure

Advantages to the User

- Highest pumping speed from the smallest possible size
- New standard regarding maintenance-free systems
- Suitability for vibration sensitive applications in the area of analytical engineering, thin-film technology, electron microscopes, research, development among others
- Flexibility due to the modular concept; the converter is optionally also available by way of a bench top unit

MAG INTEGRA – Magnetic Rotor Suspension with integrated Frequency Converter, with Compound Stage

TURBOVAC MAG W 600/700 iP

Typical Applications

- Gas analysis systems
- Particle accelerators
- Electron microscopes
- Research
- Coating systems

Technical Features

- Installation in any orientation
- DN 160 or 200 ISO-K and/or CF high vacuum connection
- DN 25 ISO-KF with clamped fore-vacuum connection
- Purge gas/venting connection DN 16 ISO-KF with clamped connection (purge/vent)
- Water or air cooling optional
- 2 slots for industrial communications modules
- Standard 9 pin 24 V SPS PLC-IO in Control Slot
- RS 232 C in Service Slot
- further interfaces can be fitted: Profibus, RS 485 C, DeviceNet, EtherNet IP, EtherCat, ProfiNet

Dimensional drawing for the TURBOVAC MAG W 600/700 iP

Pumping speed for N₂ of the TURBOVAC MAG W 600/700 iP as a function of the inlet pressure

Advantages to the User

- Highest pumping speed from the smallest possible size
- New standard regarding maintenance-free systems
- Suitability for vibration sensitive applications in the area of analytical engineering, thin-film technology, electron microscopes, research, development among others
- Flexibility due to the modular concept; the converter is optionally also available by way of a bench top unit

MAG INTEGRA – Magnetic Rotor Suspension with integrated Frequency Converter, with and without Compound Stage

TURBOVAC MAG W 1300 iP(L) to 2201 iP(L)

Typical Applications

- PVD coatings systems
- Coating of architectural glass
- Optical coatings
- LC displays
- Flat panels
- Research
- Analytical systems

Technical Features

- Installation in any orientation
- DN 200 and/or 250 in ISO-F and/or CF high vacuum connection
- DN 40 KF forevacuum connection
- Purge gas/venting connection
DN 16 KF with clamped connection (purge/vent)
- Water cooling
- Protection class IP 54
- RS 232 C in Service Slot
- 1 slot for industrial communications modules
- Standard ProfiBus
- further interfaces can be fitted:
RS 485 C, 9 pin 24 V PLC,
DeviceNet, EtherNet IP, EtherCat,
ProfiNet

Advantages to the User

- Highest pumping speed and gas throughput from a very small size
- Rugged and reliable operation in industrial applications
- Sets new benchmarks for maintenance-free systems
- Suited for vibration sensitive applications in the areas of analytical, thin-film, electron microscopy, research and development among others.
- Flexibility through the modular concept; the converter is either attached to the side or under the pump

MAG INTEGRA – Magnetic Rotor Suspension with separate Frequency Converter, with Compound Stage

TURBOVAC MAG W 600/700 P

Typical Applications

- Gas analysis systems
- Particle accelerators
- Electron microscopes
- Research
- Coating systems

Technical Features

- Installation in any orientation
- DN 160 or 200 ISO-K and/or CF high vacuum connection
- DN 25 ISO-KF with clamped forevacuum connection
- Purge gas/venting connection DN 16 ISO-KF with clamped connection (purge/vent)
- Water or air cooling optional

Advantages to the User

- Highest pumping speed from the smallest possible size
- New standard regarding maintenance-free systems
- Suitability for vibration sensitive applications in the area of analytical engineering, thin-film technology, electron microscopes, research, development among others
- Flexibility due to the modular concept; alternatively the pump is available also with an integrated frequency converter

Electronic Frequency Converters for Pumps with Magnetic Rotor Suspension MAG.DRIVE S

MAG.DRIVE S with display

Advantages to the User

- Operation of turbomolecular pumps with magnetically levitated rotors:
MAG W 300/400 P and
MAG W 600/700 P
- Easy operation through the controls
- Communication to host computer of the customer via serial interface and conventional interface possible
- Setting of speed and other functions
- Warning in case the pump is running out of specification
- Storing of all parameters in the pump's memory
- Small size and low weight
- Integrated fan
- 2 slots for industrial communications modules
- rear side:
Standard 9 pin 24 V SPS
PLC-IO in Control Slot
- front side:
RS 232 C in Service Slot
- further interfaces can be fitted:
Ethernet, Profibus, DeviceNet, RS 485 C

Accessories for Serial Interfaces RS 232 C and RS 485 C

Through these accessories many control, monitoring and information capabilities can be implemented in

connection with the electronic frequency converters and turbomolecular pumps.

All turbomolecular pumps or electronic frequency converters are supported.

PC Software LEYASSIST*

Software platform developed to intuitively control, configure, monitor Leybold vacuum products and intelligent systems through USB or serial RS232 / RS485 to USB interfaces.

Functionality:

- Auto connect to Leybold Vacuum products
- Configure and control products
- Checking alarm warning status and doing trouble shooting
- Easy configuration of intelligent pump systems around local Hub products such as TURBOVAC i / iX
- Enabling Plug&Play

* available as free download from our website

“Oils / Greases / Lubricants LEYBONOL®”.**

Operating Principle of Fluid Entrainment Vacuum Pumps

The main components of diffusion pumps, the operation of which relies on vapor-phase pump fluids are:

- Cooled pump body with intake and exhaust ports
- System of nozzles
- Pump boiler

In the case of diffusion pumps a pump fluid contained in a boiler is heated to such an extent that it is vaporized. The vapor is then forced through nozzles within the pump. The nozzles are generally designed in such a way, that they accelerate the vapor to a speed exceeding the speed of sound (Laval nozzles), thus creating a high speed vapor jet. The vapor is then deflected by the nozzles at a specific angle onto the pump body. The pump body is

cooled, so that the vaporized pump fluid condenses and is returned back to the boiler as a liquid. The pumping action of diffusion pumps and fluid entrainment pumps in general is based on the transporting capacity of the vapor jet.

The gas which is to be pumped is compressed sufficiently at the fore-vacuum port so that it can be pumped out by a backing pump.

Oil Diffusion Pumps

Compared to other fluid entrainment pumps the density of the vapor in the boiler and in the vapor jet is fairly low so that the gas molecules may almost completely diffuse into the vapor jet. Thus most of the molecules which enter the vapor jet are also pumped out.

For this reason, the pumping speed of diffusion pumps is extremely high with respect to the intake area and constant – starting at an inlet pressure of approx. 10^{-3} mbar (0.75×10^{-3} Torr) down to very low pressures – as within the pressure range the vapor jet is not influenced in any way by the pressure within the vacuum vessel.

Operating Oil Diffusion Pumps

Forevacuum

In all cases diffusion pumps require a sufficiently sized backing pump (see Technical Data). The size and type of

forevacuum pump depends on the operating conditions and the quantities of gas which are to be pumped.

1. Continuous operation at operating pressures above 10^{-4} mbar (0.75×10^{-4} Torr) – large quantities of gas.
2. Continuous operation at operating pressures below 10^{-4} mbar (0.75×10^{-4} Torr) – smaller quantities of gas.

In applications which rely on diffusion pumps, the vacuum chamber must be connected via a valve (3) and a roughing line directly to the backing pump. This is done so that the vacuum chamber may be pre-evacuated by the backing pump down to a pressure where the diffusion pump can take over. Until the high vacuum valve (4) opens, both diffusion pump and pump fluid are preserved. Before venting the vacuum chamber the forevacuum valve (2) and the high vacuum valve (4) must be closed, whereby the diffusion pump remains in the ready status.

Pumping Speed

The pumping speed of any pump is equivalent to the volume throughput through the intake opening of a pump. In the case of diffusion pumps the pumping speed for lighter gases is higher compared to heavier gases.

Backstreaming of the Pump Fluid

Undesirable backstreaming of molecules from the pump fluid is caused by the effect that some molecules are able to leave the vapor jet and thus do not arrive at the cooled pump body. Because of collisions between each other and due to reflection at the pump body, these molecules are then able to move in the direction of the vacuum chamber.

For DIP pumps the backstreaming effect amounts only to a few μg per cm^2 of intake area per minute. Backstreaming may be almost completely suppressed by including a cold cap baffle or an additional Astrotorus baffle.

Backstreaming of Oil in the Case of Diffusion Pumps

- Pump without baffle
approx. $1 \times 10^{-2} \text{ mg} \times \text{cm}^{-2} \times \text{min}^{-1}$
- Pump with cold cap baffle
approx. $1 \times 10^{-3} \text{ mg} \times \text{cm}^{-2} \times \text{min}^{-1}$
- Pump with Astrotorus baffle
($T = 10^\circ\text{C}$ (50°F))
approx. $1 \times 10^{-5} \text{ mg} \times \text{cm}^{-2} \times \text{min}^{-1}$

The values stated have been measured at an intake pressure of $< 1 \times 10^{-4}$ mbar and apply to LEYBONOL LVO 500.

Schematic for a diffusion-type vacuum pump system

Attainable Ultimate Pressure

The attainable ultimate pressure for a particular vacuum system depends not only on the type and pumping speed rating of the diffusion pump, but also on the vapor pressure of the pump fluid, shape and temperature of the baffle, leaks at connecting flanges or welded joints and the condition of the surfaces within the vacuum chamber.

When excluding all effects which contribute to an increase in pressure within

the vacuum chamber due to leaks and contamination of the vacuum chamber walls, it will be possible to attain the ultimate pressures stated in the table "Attainable Ultimate Pressures with Oil Diffusion Pumps (DIP)" given in chapter "General".

In practice the following combination has been found to work very well when needing a low vacuum free of oil vapors.

- Water-cooled cold cap baffle as a integral part of the diffusion pump together with a water-cooled Astrotorus baffle which may be installed as an additional component on the high vacuum flange of the diffusion pump.

Sealing Methods

For ultimate pressures down to 10^{-8} mbar (0.75×10^{-8} Torr) bakeout temperatures of up to 150 °C (302 °F) are sufficient. FPM [FKM (= Fluor caoutchouc), temperature resistant up to 150 °C (302 °F)] sealing rings or ultra sealing rings made of aluminum must be used.

In order to prevent pressure variations, ultra sealing rings must be used in the connections, between diffusion pump and baffle.

Ultimate pressures below 10^{-8} mbar (0.75×10^{-8} Torr) require bakeout temperatures up to 400 °C (752 °F). However, it is only necessary to bake out the vacuum chamber to 400 °C (752 °F) and to maintain a temperature gradient across the baffle or the cold trap so that a temperature of 150 °C (302 °F) is not exceeded at the intake flange of the pump.

In this way, it is still acceptable to use FPM (FKM) sealing rings or ultra sealing rings made of aluminium.

Cooling

The cooling water temperature should not exceed 25 °C (77 °F) at the intake and 30 °C (86 °F) at the discharge, otherwise sufficient condensation of the pump fluid cannot be ensured. When connecting the cooling system of the pump and the baffle in series, the cooling water must always be made to flow through the baffle first and then through the diffusion pump, because the attainable ultimate pressure in the vacuum chamber depends strongly on the condensation temperature of the pump fluid in the baffle.

Attainable Ultimate Pressures with Oil Diffusion Pumps

Attainable Ultimate Pressure ¹⁾

LEYBONOL LVO 500

Without baffle	mbar (Torr)	1.5×10^{-6} (1.1×10^{-6})
With cold cap baffle	mbar (Torr)	5.0×10^{-7} (3.8×10^{-7})
With Astrotorus baffle	mbar (Torr)	1.5×10^{-7} (1.1×10^{-7})

Products

DIP Pumps Water-Cooled

DIP 12 000

DIP 20 000 with Power Controller

The DIP range of pumps was developed for operation in industrial systems. Excellent vacuum performance data combined with the inherent ruggedness of this kind of pump, make our diffusion pumps a reliable component in high and medium vacuum applications.

Advantages to the User

- High pumping speeds in the fine and high vacuum ranges
- Low attainable ultimate pressure
- Integrated, water-cooled cold cap baffle guarantees low oil backstreaming rates into the vacuum chamber
- Low oil losses (even at high gas throughputs) by integrated water-cooled forevacuum baffle
- High forevacuum resistance even at reduced heating power
- The heating cartridges are accessible from the outside via heating inserts which are built into the boiler. This ensures a quick exchange of single heating cartridges (even when the pump is hot)
- A separate automatic circuit breaker for each heating cartridge ensures a high level of electrical safety
- A standard built-in thermostat acts as an thermal overload switch and ensures that the heating cartridges can not overheat
- All pumps are prepared for installation with an over-temperature switch (optional) for checking the cooling water circuit, and a contact thermometer (optional) to monitor the operating temperature of the diffusion pump
- Indication of the oil level by sight-glass permits simple checking of the current oil level
- All DIP pumps are delivered with their inside chamber cleaned in such a manner that it is free of oil. The inside is evacuated. In the condition as delivered, the pumps may be also operated with silicone oil
- Utilisation of the DIP power controller cuts power consumption by up to 30% without impairing pump performance (option)

Typical Applications

The diffusion pumps from the DIP range are used in coating systems, vacuum melting and drying systems as well as in vacuum furnaces in the area of metallurgy.

Supplied Equipment

The DIP pumps are supplied ready for connection but without the filling of pump fluid.

The inside of the pump is cleaned before delivery to such an extent that it is free of oil. The inside is evacuated. High and forevacuum flanges are equipped with gaskets and centering rings having shipping flanges and complete with clamping components.

DIJ Pumps

Water-Cooled

DIJ 20 with plug (right), DIJ 20 with fuse box (middle) and DIJ 630 with energy saving unit (EER) (right)

The Leybold oil diffusion pumps are ideal for all industrial high vacuum applications.

The DIJ series impresses with innovative and energy-efficiency construction.

Important features are a new heating conception; variable flange connections; fully equipped with fore line baffle and cold cap baffle; electrical connect variants and a powerful five stage nozzle system.

Advantages to the User

- Lowest operation costs by minimized energy consumption
- Stable throughput in the 10^{-2} to 10^{-3} mbar range (e.g. for sputtering or steel degassing)
- Flexible flange design
Flange variants:
 - ANSI / Inch flanges (with O-ring)
 - ISO-F or ISO-K flanges (with centering ring)
- Highest system uptime
- Smart temperature control ensures minimum load and longest lifetime for heaters and oil
- Unique baffle design
- Various electrical connection possibilities:
 - Three different connection variants available incl. energy control system (ECU)
- 4 + 1 stage system design:
 - The 4 diffusion pump stages provide excellent high-vacuum pumping speed
 - The additional jet-stage ensures stable throughput at pressures $> 10^{-3}$ mbar

Typical Applications

The diffusion pumps from the DIP range are used in coating systems, vacuum melting and drying systems as well as in vacuum furnaces in the area of metallurgy.

Supplied Equipment

All DIJ pumps are shipped from the factory without pump fluid installed.

Included as standard equipment with the pump are

- centering ring with centering star, O-ring and outer ring for the high-vacuum flange,
- centering ring with insert for forevacuum baffle, O-ring and outer ring for the forevacuum flange.

The high-vacuum and forevacuum flanges are closed with shipping flanges and claws. The insides of the pumps have been cleaned; they are evacuated prior to shipment.

Oil Booster OB 6000 to OB 18000

Oil Booster OB 6000 (left), OB 12000 (middle) and OB 18000 (right)

The design of the oil booster pumps from Leybold is well proven in industrial high vacuum applications. They excel above all through excellent vacuum performance data and are, owing to their rugged design a reliable component in many medium and high vacuum units.

The water cooled oil booster pump was developed in particular for applications in the rough and medium vacuum range. The pumps from the OB line from Leybold deliver when properly deployed, a maximum pumping speed at high gas throughputs.

Advantages for the User

- Very high pumping speed from a small sized pump
- Pump sizes 6000, 12,000 and 18,000 m³ per hour
- Simple to operate
- Rugged and long life
- Selectable flange connections (OB 12,000 and 18,000 only)
- Small manageable amount of spare parts
- Pump components (e.g. heating elements, diffusion corpus, jet corpus) are similar for all OB sizes and can be exchanged easily
- Modern electronic pump monitoring (PLC controlled)
- High efficiency due to direct heating
- Optimized heating design for long oil change intervals

Typical Applications

- Vacuum Induction Melting (VIM) or Vacuum Induction Degassing (VID) of special alloys are utmost important process steps in the metallurgy.
- Depending on the required steel-quality, the required process pressure in such applications is particularly low.
- Secondary metallurgy processes are becoming more popular thanks to the greater demand for better steels e.g. in the automotive, construction and rail markets.

Supplied Equipment

The OB pumps are plug-and-play but are delivered without pump fluid.

The pump chamber is free of oil and has been cleaned.

The inside volume is evacuated. The high vacuum and forevacuum flanges are equipped with sealing and centering rings as well as shipping flanges. Moreover, the electric circuit breaker box and the cooling water manifold have been installed for immediate connection.

The included Pt100 temperature sensor ensures safe oil temperature monitoring.

The installed overtemperature protection switch monitors and ensures safe operation of the pump.

Pumping speed curves of the Oil Booster OB 6000 to OB 18000 as a function of the intake pressure

LEYBOJET 630

Water-Cooled

LEYBOJET 630

The oil diffusion pumps from Leybold are well proven in industrial high vacuum applications.

They excel through their excellent vacuum performance data and owing to their rugged design are a reliable component in many medium and high vacuum systems.

The water-cooled LEYBOJET 630 was developed especially with the medium vacuum in mind.

Advantages for the User

- High and stable pumping speed well into medium vacuum range
- Low ultimate pressure
- Low oil backstreaming due to integrated water-cooled cold cap baffle
- High forevacuum tolerance
- Each heating cartridge is protected by a separate circuit breaker
- In maintaining the well proven heating system - heating insert with thermally conducting panels and heating cartridges - the LEYBOJET 630 is now equipped with an additional ejector nozzle for the purpose of obtaining a stable pumping speed well into the medium vacuum range

Typical Applications

The principal areas of application of the LEYBOJET 630 are modern sputtering processes as well as vacuum melting and drying plants.

Supplied Equipment

The LEYBOJET 630 are supplied ready for connection but without the filling of pump fluid.

The inside of the pump is cleaned before delivery to such an extent that it is free of oil. The inside is evacuated. High and forevacuum flanges are equipped with gaskets, centering rings, shipping flanges, and clamping components.

Temperature dependant Switching Components for Automatic Pump System Control

The operational status of the diffusion pump depends on the temperature of the pump fluid in the pump boiler. Through temperature dependent switching components which are inserted into the pump boiler it is possible to monitor the operational status of the diffusion pump and signal its status to a process controller.

For this, the diffusion pump requires two thresholds. Depending on the type of pump, the upper threshold should be between 180 and 200 °C (356 and 392 °F) and the lower threshold between 90 and 100 °C (194 and 212 °F).

The upper threshold indicates that the diffusion pump is ready for operation and thus actuates certain devices, for example opening of the high vacuum valve ahead of the diffusion pump.

The lower threshold indicates that the diffusion pump has cooled down to such an extent that the backing pump and the cooling water supply may be switched off.

Over-temperature protection switches are used to monitor the temperature of the cooling water in the cooling water circuit of the diffusion pumps. When the temperature rises to unacceptably high levels (for example when the cooling water supply fails) the heater in the diffusion pump is switched off (correct electrical connection to the main supply is required). The use of over-temperature protection switches avoids unnecessary alarms that may be triggered by contaminated water when only a water flow monitor is used. The over-temperature protection switch is screwed on to a contact plate which is soldered to the cooling pipe on the

Over-temperature protection switch

pump's body.

Max. switching current: 5 A (230 V, 50/60 Hz).

Contact thermometer with a range from 0 to 400 °C (32 to 752 °F).

Through a trailing pointer two switching thresholds may be set up independently. The current oil temperature and the thresholds which have been set up can be read off at the

location of the diffusion pump. The contacting thermometer is not suited for remote signaling of temperatures.

Resistance thermometer Pt100 sensor. The measurement range of this sensor depends on the temperature display unit used by the customer where also the required thresholds are set up. The Pt100 sensor is ideal for remote signaling of temperatures.

Monitoring Instruments

Protection against Overheating

Water flow monitors are installed in the cooling water return section of the diffusion pump. When the cooling water throughput drops below a certain level, either the heater in the diffusion pump is switched off or a warning light or signal is triggered, depending of the type of circuit.

Measurement range: 1 to 40 l/min
(0.2 to 10.6 gal/min)

The water throughput may be set within the limits stated with a high degree of reproducibility.

Water flow monitors may be installed in any orientation.

Max. switching capacity:
100 VA (230 V, 50/60 Hz).

Ordering Information

Water Flow Monitor

	Part No.
Water flow monitor	500006623

Protection against Power Failure

A SECUVAC valve (see Product Section "Vacuum Valves") must be installed in the forevacuum line in order to prevent damage to the diffusion pump or the pump fluid in the event of a power failure affecting backing pumps which are not equipped with an automatic isolation valve. Rotary vane vacuum pumps from the TRIVAC B series are equipped with an automatic Pressure relief valve (intake isolation valve) as standard.

Protection against Pressure Increases in the Forevacuum Line

For protection against a pressure increase in the forevacuum line which is not caused by a power failure you may use our vacuum gauges which offer an adjustable switching threshold (see Product Section "Vacuum - Measuring, Controlling").

Power Controller

Power controller with integrated USB interface

Ethernet interface for PLC data integration

When it comes to the aspect of economic and efficient operation of diffusion pumps, power consumption plays an important role.

Through our DIP power controller, you may now drastically cut your power consumption – and this without impairing pump performance in any way!

Leybold Solutions provides a unique energy control unit with less thermal loss to control the heating power to save energy significantly!

Advantages to the User

- Energy saving up to 30% (low costs and ROI in less than three years)
- Further potential savings through temperature decrease in standby-mode
- High quality regulation with customized software
- Increased operation safety and comfort
- Improved service life for oil and heating cartridges
- Easy and exact to operate via PLC or manual directly at the pump
- Uncomplicated integration of generated data into your own process control or export data via USB port
- Strategically process analysis and optimization by interpretation of energy control unit data

Adsorption Traps with Aluminium Oxide Insert

Adsorption traps are installed in all those cases where an oil-free vacuum is to be produced with oil-sealed vacuum pumps.

Advantages to the User

- Backstreaming of oil is reduced by 99%
- Long service life
- High conductance
- Filling can be easily exchanged
- Improvement in the ultimate pressure attained by backing pumps by one order of magnitude
- Stainless steel housing and insert
- NBR gasket

Typical Applications

- Product of an oil-free vacuum

Supplied Equipment

- Complete with insert
- Without adsorbent

Conversion of Units

Kelvin (K), Celsius (°C), Fahrenheit (°F)

Calculation from	Calculation to	Formula
Celsius	Fahrenheit	$^{\circ}\text{F} = ^{\circ}\text{C} \times 1.8 + 32$
Celsius	Kelvin	$\text{K} = ^{\circ}\text{C} + 273.15$
Kelvin	Celsius	$^{\circ}\text{C} = \text{K} - 273.15$
Kelvin	Fahrenheit	$^{\circ}\text{F} = \text{K} \times 1.8 - 459.67$
Fahrenheit	Celsius	$^{\circ}\text{C} = (^{\circ}\text{F} - 32) / 1.8$
Fahrenheit	Kelvin	$\text{K} = (^{\circ}\text{F} + 459.67) / 1.8$

The following applies to absolute zero:
 $0 \text{ K} = -273.15 \text{ }^{\circ}\text{C} = -459.67 \text{ }^{\circ}\text{F}$

Cryo Pumps

Cryo pumps are gas entrapment vacuum pumps for the pressure range from 10^{-3} to $\leq 10^{-11}$ mbar (0.75×10^{-3} to $\leq 0.75 \times 10^{-11}$ Torr). The principle of operation is that gaseous substances are bound to the cold surfaces within the pump by means of cryocondensation, cryosorption or cryotrapping.

In order to be able to produce a high or ultra-high vacuum, the cold surfaces (cryopanel) must be cooled to a sufficiently low temperature. Depending on the type of cooling system used a distinction is made between refrigerator cryo pumps, bath cryo pumps and evaporator cryo pumps.

Leybold manufactures refrigerator-cooled cryo pumps as well as liquid nitrogen supported cryo pumps.

Advantages to the User

Advantages offered by the pumping principle

- High effective pumping speed for all gases
- Extremely high pumping speed for H_2O (water) and H_2 (hydrogen)

For a given diameter of the high vacuum flange, the cryopump offers the highest pumping speed of all high vacuum pumps.

Advantages offered by Design

In contrast to gas transfer high vacuum pumps, cryo pumps do not have any mechanically moving, oil or grease lubricated parts on the vacuum side.

The following advantages are a direct result of this design characteristic:

- Hydrocarbon-free vacuum in the pressure range from 10^{-3} to $\leq 10^{-11}$ mbar (0.75×10^{-3} to $\leq 0.75 \times 10^{-11}$ Torr).
- Insensitivity to mechanical disturbances from particles coming from the process or external vibrations.

Further Advantages

- More compact than comparable pump systems offering a pumping speed of over 1500 l/s
- Backing pump is only required during start-up and during regeneration
- User friendly process control and pump control
- Favorable price-performance ratio and low running costs especially at higher pumping speeds

The cryo pumps are cooled by the well-proven two-stage refrigerators from Leybold's COOLPOWER line (Gifford/McMahon principle).

The design of a refrigerator cryopump from the COOLVAC range is shown schematically in the figure below.

The first stage of the cold head (6) cools the thermal radiation shield (7) and the baffle (8) of the pump.

Both are made of copper with high thermal conductivity in order to optimally utilize the available refrigerating capacity.

Operating temperatures of 45 K to 80 K are reached depending on the type of pump and on the operating conditions. Mainly water but also carbon oxides are pumped here.

The second stage of the cold head (9) is used to cool the cryopanel (10). These pumping surfaces are also made of copper of high thermal conductivity and they are tightly linked thermally to the second stage of the cold head.

Depending on the operating conditions, operating temperatures of 10 to 20 K are attained.

Here the process of cryocondensation of N_2 (nitrogen), O_2 (oxygen) and Ar (argon) will take place.

The inner part of the pumping surfaces are additionally covered with activated charcoal. Here the process of adsorption (cryosorption) of H_2 (hydrogen), Ne (neon) and He (helium) will take place.

COOLVAC refrigerator cryopump

All cryo pumps from the COOLVAC range are equipped with all safety related components, particularly with a pressure-relief device and safety valve with flange hub (4, 5) which is equipped with an additional DN 40 KF flange for connection of an exhaust line.

The pump's body is made of high-quality stainless steel.

Helium compressors from the COOLPAK range are required for operating the COOLPOWER cold heads, which are incorporated with-in the COOLVAC range of cryo pumps.

Regenerating Cryo Pumps

An important aspect of the operation of cryo pumps is that of regeneration. Since a cryo pump is a gas entrapment pump, the pumped gases must be removed from the pump before the capacity limit is exceeded.

The so-called "regeneration" occurs by switching off the compressor unit and heating up the cold surfaces to room temperature. The pumped gases are pumped out by means of a roughing pump. As soon as the vacuum pressure is low enough, the cryo pump can be cooled down again. Finally, when the operating temperature has been reached, the regeneration process is complete.

Various procedures are available for regeneration as listed below:

- Heating up through self-heating after the refrigerator has been switched off, and subsequent re-cooling
- Heating up with the support of a dry, warm inert gas
- Heating up by means of an electrical heater on the cold surfaces.

These methods can be combined with each other.

iClassicLine Cryo pumps with regulated regeneration system

The cryo pumps from the *iClassicLine* (iCL) range are gradually heated up to room temperature by means of electrical heaters at both cold head stages. Pressure, temperature and heating power are monitored in detail within the cryo pumps.

During the process the pumped gases are released one after the other in the following sequence:

- Gases adsorbed at the cryopanel (e.g. hydrogen, helium, neon),
- Gases condensed at the cryopanel (e.g. nitrogen, oxygen, argon),
- Gases and vapors which have condensed on to the baffle and thermal radiation shield (e.g. water vapor).

The benefit of Leybold's regeneration process described above is that no additional purge gas is required during the regeneration of inert, unreactive gases.

Our application support team is on hand to answer any safety questions you may have in relation to client-specific process gases.

The accessories required for automatic regeneration, such as temperature sensors on both cold head stages, pressure gauge head, fore-vacuum valve and electrical controller are an integral part of the cryo pump in the *iClassicLine* range. Additional accessories can be supplied on request.

BasicLine cryo pumps with no regulated regeneration system

In the case of cryo pumps from the *BasicLine* (BL) range, regeneration takes place manually in two sub-steps:

- Switching off the refrigerator system and waiting until room temperature is reached. (The temperature can be read off by the customer from the built-in silicon diode).
- Re-cooling after a sufficiently low pressure is reached in the cryo pump.

Additional components such as temperature display unit, pressure gauge head and fore-vacuum valve are not part of the standard scope of delivery for *BasicLine* cryo pumps, although they are available as accessories on request. Leybold will be pleased to advise you on the optimum component configuration for your application.

The cryo pumps from both the *BasicLine* range as well as those from the *iClassicLine* range are available in suction capacity classes from 1500 l/s to 60000 l/s.

Multiple Operation of Refrigerator Cryo Pumps

The powerful Leybold compressor units COOLPAK 6000 H open up the possibility of operating up to three refrigerator cryo pumps simultaneously.

Advantages to the User

- Significantly reduced investment and operating costs
- Small footprint

Cold Heads

A refrigerator is a cooling machine which operates on the basis of a thermodynamic cycle (Carnot) to produce cryogenic temperatures ($T \leq 120 \text{ K}$).

Refrigerators operating according to the Gifford/McMahon principle have succeeded over other methods of cooling cryo pumps and cryogenic applications. Exclusively such coolers are produced and used by Leybold.

The cold heads consist essentially of three modules:

- Drive module
- Displacement unit
- Cold head stage(s)

Helium compressors from the COOL-PAK range are used to drive the cold heads from the COOLPOWER range.

In addition to the standard products, Leybold also offers these cold heads, as well as cryo pumps, in custom designs in accordance with customer requirements.

Gifford/McMahon-Refrigerators

Advantages to the User

- No liquid helium and no liquid nitrogen are required
- Very simple to operate
- Easy process control and temperature control via a computer
- No space problems since cold head and compressor unit can be installed and operated apart
- Installation of the cold head basically in any orientation
- High reliability
- Long periods of operation without maintenance

Typical Applications

- Cooling of
 - cryopanel in cryo pumps thereby producing high or ultra-high vacuum
 - superconducting magnets; for instance in magnetic resonance tomography
 - samples for spectroscopic analysis in solid state and surface physics
 - high-temperature and low-temperature superconductors
 - semiconductors
 - infrared and gamma detectors
- Recondensation of liquids and cleaning of gases
- Calibration of sensors

Dual-stage Gifford/McMahon cold head (schematic diagram)

Cold heads from the COOLPOWER range

The standard range of single-stage and double-stage cold heads matches a wide range of applications.

Leybold is offering refrigerators with usable refrigerating powers from 20 W to 250 W at 80 K (single-stage).

In two-stage systems, the refrigeration capacities of the second stage range in between 5 W and 20 W at 20 K.

Pneumatically driven cold heads

Advantages

- Simple Design

The pneumatic drive system for the displacer of these cold heads from Leybold consists of only two mechanically moving components: the rotating control valve and the synchronous motor driving the control valve.

- Easy and quick maintenance

Owing to the simple design of the built-in cold heads, maintenance is easy. Maintenance can be performed in place without detaching the cold head from the vacuum chamber.

Mechanically driven cold heads

Advantages through low vibrations

With these cold heads, movement of the displacer unit is automatically controlled via a crank drive, which leads to low vibration levels.

Here, too, maintenance at the place of use can be carried out without impacting the surrounding infrastructure, in particular with no breaking of the chamber's vacuum by the service personnel.

Advantages through high reliability

Leybold cold heads are used in applications which place particularly high demands on reliability, such as magnetic resonance imaging in medical technology, the cooling of low and high temperature superconductors, and the cooling of detectors in telescopes for astronomy.

Refrigeration capacity diagrams (see next page of the catalogue)

On the following page of the catalogue you will find the refrigeration capacity diagrams for our single-stage and double-stage COOLPOWER cold heads.

The interpretation of the diagrams for our double-stage cold heads is explained using the example of the refrigerator cold head COOLPOWER 5/100 (see diagram on next page). If applying heat loads of 100 W on the 1st stage and of 6 W on the 2nd stage, simultaneously, then the intersection point (●) 100 W / 6 W of the two lines gives the expected 1st stage and 2nd stage temperature of 80 K and of 20 K, respectively.

Without thermal load (left lower intersection point (○) 0 W / 0 W of this "load map"), ultimate temperatures of < 30 K and of < 10 K will be reached on the 1st stage and on the 2nd stage, respectively.

Refrigerating Capacity of Cryogenic Cold Heads

Typical refrigerating capacity of the single-stage cold heads COOLPOWER 50, COOLPOWER 140 T and COOLpower 250 MD

Typical refrigerating capacity of the cold head COOLPOWER 7/25

Typical refrigerating capacity of the cold head COOLPOWER 5/100

Typical refrigerating capacity of the cold head COOLPOWER 10 MD

The refrigerating capacities stated apply to vertical operation with the cold end at the bottom.

Compressor Units

COOLPAK 2000 and COOLPAK 6000 H compressors are available for single and multiple operation of the cold heads from the COOLPOWER line as well as for operation of cryo pumps from the COOLVAC line.

The compressors are characterised by high reliability and ease of maintenance. The maintenance interval is as long as 30,000 hours depending on the application. The low level of noise and vibration is achieved through the

exclusive use of scroll compressors and specially selected components.

The possibilities for single and multiple operation of refrigerator cryo pumps are given in the table below:

Compressor Unit	For the operation of

COOLVAC ProfiBus module ProfiBus – RS232 Converter for COOL.DRIVE and CRYOVISION either COOLVAC ProfiBus module connected to COOL.DRIVE control and monitoring unit of each cryo pump (in this case CRYOVISION and network control not to apply)	844000V1		844000V1 (2x)		844000V1 (3x)	
or COOLVAC ProfiBus module connected to CRYOVISION ²⁾	844000V1		844000V1		844000V1	

The arrangement of the components is shown in the chapter "Accessories" under the heading "iCOOLVAC iClassicLine, System Components".

¹⁾ The length of the control cable should match to the length of the flexlines.

²⁾ At multiple operation with reduced communication speed to single cryo pumps.

COOLVAC 2000 iCL

Advantages to the User

- Hydrocarbon-free high vacuum
- High capacity for argon and hydrogen
- High crossover value
- Simple operation
- Trouble-free integration into complex systems
- Fully automatic regeneration through integrated COOL.DRIVE controller ¹⁾
- Easy on-site servicing without pump disassembling and reconditioning of the vacuum system possible

Typical Applications

- Evaporators
- Sputtering systems
- Ion implanters
- Optical coating systems
- Metallization systems

Dimensional drawing for the COOLVAC 2000 iCL (DN 250 ISO-K)

COOLVAC 3000 iCL

Advantages to the User

- Hydrocarbon-free high vacuum
- High capacity for argon and hydrogen
- High crossover value
- Simple operation
- Trouble-free integration into complex systems
- Fully automatic regeneration through integrated COOL.DRIVE controller ¹⁾
- Easy on-site servicing without pump disassembling and reconditioning of the vacuum system possible

Typical Applications

- Evaporators
- Sputtering systems
- Ion implanters
- Optical coating systems
- Metallization systems

Dimensional drawing for the COOLVAC 3000 iCL (DN 320 ISO-K)

Technical Data

COOLVAC

		2000 iCL	3000 iCL

Cryo Pumps for Manual Operation, BasicLine

The COOLVAC cryo pumps of the BasicLine version are identical to the COOLVAC cryo pumps of the iClassicLine version concerning the technical data for pumping speed, capacity, cooldown time, built-in cold heads, maximum throughput, built-in temperature sensors for the second stage (Si diode) and the corresponding current feedthroughs.

The standard BasicLine models do **not** include the following components:

- Electrical regeneration heaters
- Temperature sensors for the first stages of the cold head(s)
- Vacuum gauge head
- Fore vacuum valve
- Temperature readout / display unit for the silicon diode(s)

We are glad to advise you of our assortment of accessories for our COOLVAC BasicLine range of cryo pumps.

All cryo pumps of the *iClassicLine* series (iCL) described above can be delivered as *BasicLine* types, too. Please consult with our technical support.

E.g. for the following part numbers:

	Part No.
COOLVAC 10000 BL-V, DN 500 20" ANSI	844511V1004
COOLVAC 10000 BL-V, DN 500 ISO-K	844511V1006

Cryo Pumps with Liquid Nitrogen Cooling of Radiation Shield and Baffle of Cryo Pump

COOLVAC 30000 BL LN₂ and COOLVAC 60000 BL LN₂

COOLVAC 30000 BL LN₂

COOLVAC 60000 BL LN₂ with flange DN 1250 ISO-F

Advantages to the User

- Hydrocarbon-free high vacuum
- High pumping speed for water vapor and nitrogen
- Operating with only one compressor unit through liquid nitrogen (LN₂) cooling of radiation shield and baffle
- Controlling of radiation shield and baffle temperatures by additional temperature sensor

Typical Applications

- Space simulation chambers
- Vacuum furnaces

Dimensional drawing of COOLVAC 30000 BL LN₂

Dimensional drawing of COOLVAC 60000 BL LN₂

Technical Data

COOLVAC 30000 BL LN₂

COOLVAC 60000 BL LN₂

High vacuum flange	DN	35"ANSI	1250 ISO-F
Fore vacuum flange	DN	63 ISO-K	63 ISO-K
Flange with 4-pole current feedthrough for silicon diode*	DN	16 ISO-KF (2x)	16 ISO-KF (2x)
Flange with 6-pole current feedthrough for 3 Pt 100 (radiation shield and baffle halves)	DN	40 ISO-KF	40 ISO-KF
Pressure-relief device with flange connection for gas exhaust line	DN	40 ISO-KF	40 ISO-KF
Flange with abnormal temperature protection for the regeneration heaters of the built-in cold head	DN	40 ISO-KF	40 ISO-KF
Pumping speed			
H ₂ O	l/s	93000	180000
Ar / N ₂	l/s	25000 / 30000	47000 / 57000
H ₂	l/s	30000	60000
Capacity			
Ar / N ₂	bar x l	6500	9000

³⁾ The length of the control cable should match to the length of the flexlines.

Cold Heads, Pneumatically Driven Single-Stage Cold Heads COOLPOWER 50 and 140 T

- For installation mostly in any orientation
- High refrigerating capacity
- No liquid refrigerants are required
- Very simple to operate
- Short cooldown time

- Cooling of samples, sensors and detectors
 - e. g. cooling of detectors in astronomy
- Cooling of HTS superconductors
- Cooling in magnetic equipment
- Cooling of surfaces for pumping of gases
- Cryogenic process gas cleaning
- Condensation, resublimation and freezing of gases

Cold Heads, Mechanically Driven

Single-Stage Cold Head COOLPOWER 250 MD

Dual-Stage Cold Head COOLPOWER 10 MD

Single-stage Cold Head COOLPOWER 250 MD

Dual-stage Cold Head COOLPOWER 10 MD

Advantages to the User

- Excellent cooling performance
- up to 250 W at 80 K by press-button operation ^{1) 2)} (COOLPOWER 250 MD)
- 18 W at 20 K by press-button operation (COOLPOWER 10 MD)
- High reliability
- Design optimized for MTBF 100,000 h
- Long and maintenance-free operation
- Low vibration due to directly driven displacer
- No liquid refrigerants are required
- Very simple to operate
- Short cooldown time
- Easy operation
- Plug & Cool – as usual for all Leybold GM coolers
- Simple variation of motor speed via the COOLPAK MD compressor unit

COOLPOWER 250 MD – one of the strongest single-stage GM cooler available on the market:

- High cooling capacity of > 175 W at 80 K
- Cooling capacity up to 250 W at 80 K possible ^{1) 2)}

COOLPOWER 10 MD - the strongest 10 K GM cooler available on the market:

- High 2nd stage cooling capacity of > 18 W at 20 K
- High 1st stage cooling capacity of > 25 W at 40 K and 110 W at 80 K

Typical Applications

The COOLPOWER 250 MD is a mechanically driven single-stage Gifford McMahon (GM) cryo cooler and ideally suited for

- Shield cooling of superconducting magnets in MRI
- Cooling of cryopanel in special Cryo pumps
- Cooling of larger samples and devices; especially
 - High temperature superconductor coils, wires and bulk materials
 - Recondensation of liquid refrigerants such as nitrogen and argon
 - Cleaning of gases
 - Samples for spectroscopic investigations in solid state and surface physics
 - Infrared and gamma detectors
- Calibration of sensors

The COOLPOWER 10 MD is a mechanically driven double-stage Gifford McMahon (GM) cryo cooler and ideally suited for

- Cooling of cryo probes in NMR spectrometers
- Shield cooling of superconducting magnets in MRI
- Cooling of cryopanel in special Cryo pumps and thus generation of high vacuum and ultra-high vacuum pressures
- Cooling of larger samples and devices; especially
 - High temperature superconductor coils, wires and bulk materials
 - Recondensation of liquid refrigerants such as H₂, Ne
 - Samples for spectroscopic investigations in solid state and surface physics
 - Infrared and gamma detectors
- Calibration of sensors

Compressor Units for Pneumatically Driven Cold Heads and Pumps, Water Cooling

COOLPAK 2000/2200

Compressor unit COOLPAK 2000 (2200 is similar)

Advantages to the User

- High efficiency and increased performance for cryogenic pumps and refrigerators
- High long-term reliability due to long-life and highly efficient components and improved oil management
- Very quiet and low vibration operation through the innovative horizontally suspended scroll compressor
- Simple installation and operation
- Global mains voltage compatibility
- Perfect integration within complex systems due to the 24 V Sub-D interface
- Simple adsorber replacement, otherwise maintenance-free
- Small footprint
- Low cost of ownership

Compressor Units for Pneumatically Driven Cold Heads and Pumps, Water Cooling

COOLPAK 6000 H/6200 H/6000 HD

Compressor units COOLPAK 6000 H/6200 H/6000 HD

Used to drive cold heads with pneumatically driven displacer pistons, i.e. for individual operation of the COOLPOWER cold heads 140 T and 5/100, but also older cold heads such as the RGS 120, RGD 580 and 1245, as well as the multiplexing of COOLPOWER cold heads 50 and 7/25.

In addition, these compressors are used to operate COOLVAC cryo pumps with integrated cold heads of these types.

Advantages to the User

- Highly effective and even more powerful when connected with Leybold cryo pumps and refrigerators
- Excellent long-term reliability owing to the modular design and the long life components
- Silent and low vibration operation through scroll compressors
- Simple installation and operation
- Global power supply compatibility
- Easy integration in complex systems due to 24 V DC or RS 232 C interfaces
- Almost maintenance-free
- Small footprint
- Low cost of ownership

¹⁾ At a cooling water entry temperature of 25 °C (77 °F).

²⁾ At 14 barg filling pressure.

³⁾ Only for COOLPAK 6000 HD.

⁴⁾ Series 5400 from Aeroquip, coupling size "-8", or compatible types.

Compressor Units for Mechanically Driven Cold Heads and Pumps, Water Cooling

COOLPAK 6000 HMD/6200 HMD

Compressor unit COOLPAK 6000 HMD/6200 HMD

Serves the purpose of individually driving the cold heads with mechanically driven displacers; i.e. COOLPOWER 250 MD and 10 MD.

In addition, these compressor units are also used for operating the COOLVAC cryo pumps 30000 BL LN₂ and COOLVAC 60000 BL LN₂.

Advantages to the User

- Highly effective and even more powerful when connected with Leybold cryo pumps and refrigerators
- Excellent long-term reliability owing to the modular design and the long life components
- Silent and low vibration operation through scroll compressors
- Small footprint
- Simple installation and operation
- Global power supply compatibility
- Easy integration in complex systems due to 24 V DC or RS 232 C interfaces
- Variable cold head motor speed, adjustable using keys on the power module or RS232C interface
- Long maintenance-free period of operation

All flexible pressure lines, adaptor pieces, bends, isolating pieces, line couplings and gas manifolds are equipped with self-sealing Aeroquip fittings and filled in the factory with high-purity helium gas (purity: 99.999%). The filling pressure is 16 barg.

¹⁾ Minimum bending radius: 30 cm (11.81 in.).

²⁾ Only suited for pneumatically driven cold heads and cryo pumps.

Accessories for Cryo Pumps / Cryogenics

Controllers and Monitoring Units for Cryo Pumps

CRYOVISION

Optional Display Unit for COOLVAC iCL Cryo Pumps with COOL.DRIVE pump controller

Advantages to the User

- Visualisation of all *iClassicLine* cryo pump control processes with COOL.DRIVE integrated control unit via the integrated 7" (177.8 mm) touchscreen.
- Interface to customer's system controller for single or multiplex operation for cryo pumps from the *iClassicLine* range
- Output of measurement signals of all pressure and temperature sensors that are connected, along with the display of status reports of all pumps connected to the network
- Easily integrated within customer's system control

Typical Applications

- For automated operation of the COOLVAC cryo pumps of the *iClassicLine*

Control and Display Unit CRYOVISION

The intelligent control unit CRYOVISION automatically controls and monitors up to 10 COOLVAC *iClassicLine* cryo pumps.

Online monitoring, help functions and a service interface for ease of diagnosis and software updates via the built-in USB interface are just a few of its user-friendly features.

The CRYOVISION can be installed as a "stand alone system" or remote controlled via an interface.

Furthermore, an optional ProfiBus module is available for communication with the individual cryo pumps in single and multiplex operation via the Profi-Bus.

Technical specifications

- Deployable as a desktop unit or as a mounted unit in a 19" rack
- Operation via 7" (177.8 mm) touchscreen or rear-sided interfaces

Scope of delivery

- Stylus
- Power supply connector
- Adhesive rubber feet for use as a desktop unit
- Installation kit for 19" rack installation
- Installation and operation manual

Technical Data**CRYOVISION**

Operating voltage, $\pm 10\%$	V DC	24 ¹⁾
Power consumption	W	11
Ambient temperature during operation	°C	+5 to +40
Dimensions (W x H x D)	mm (in.)	213 x 128.5 x 160 (8.39 x 5.06 x 6.3) [1/2 19" 3 HU]
Weight	kg (lbs)	1.9 (4.19)

¹⁾ Provided via the CRYOVISION – COOL.DRIVE control line or optionally via an external, separate power supply.

Ordering Information**CRYOVISION**

Optional Interface Module

COOLVAC ProfiBus Module ProfiBus – RS232 converter for COOL.DRIVE und CRYOVISION	844000V1
----------------------------------------------------------------------------------------	----------

COOLVAC ProfiBus Module

Optional ProfiBus – RS232 converter for COOLVAC iClassicLine cryo pumps with COOL.DRIVE control unit and CRYOVISION display unit

Advantages to the User

- Direct control and monitoring of the current *iClassicLine* range of pumps with COOL.DRIVE controllers using the ProfiBus DP protocol
- Control and monitoring of all *iClassicLine* cryo pumps connected to the CRYOVISION display unit on the network using the ProfiBus DP protocol
- Control and monitoring of older cryo pumps from the ClassicLine range via the corresponding COOLVAC system controller
- Configured as a top-hat rail module for straightforward rack installation.

Typical Applications

- Conversion of Profibus DP commands into RS232 commands and of RS232 response messages into Profibus DP response messages for the RS232 interfaces of the COOL.DRIVE controllers on the *iClassicLine* cryo pumps and/or for the RS232 interfaces of the optional CRYOVISION display unit, and for the RS232 interface of the COOLVAC system controller of the earlier COOLVAC ClassicLine range of cryo pumps.

COOLVAC ProfiBus Module

The COOLVAC ProfiBus module enables the simple and straightforward control and monitoring of cryo pumps from the current *iClassicLine* range and/or the earlier ClassicLine range of pumps via the RS232 interface of the attendant control and display units COOL.DRIVE and CRYOVISION or COOLVAC SC via the Profibus DP standard.

The attendant GSD file is available on our homepage.

Technical specifications

- Plastic casing, ventilated
- Combination installation feet for top-hat and C-section rails
- ProfiBus DP slave interface module
- ProfiBus DP V0 conforming to IEC 61158-2 and IEC 61784 Type 3
- ProfiBus DP address range Hex \$01...\$7D selectable via switches and \$7E selectable via software; corresponds to decimal numbers 1...126.
- ProfiBus terminating resistor can be cut in using a switch in the module
- ProfiBus connection via a 9-way D-sub socket
- RS232 interface lead connection using pluggable screw terminals

Scope of delivery

- ProfiBus module for top-hat rail installation
- 3m RS232 connection lead
- Installation and operating instructions

Technical Data**COOLVAC ProfiBus Module**

COOLVAC iClassicLine, Dual and Multiple System Configuration

Control options for three pumps

COOLVAC iClassicLine, Dual and Multiple System Configuration

Control options for several pumps with one built-in COOL.DRIVE each

Low Temperature Measuring Instrument MODEL 211S

Advantages to the User

- Supports one silicon diode
- 3-digit LED display
- Temperature readout between 1 and 450 Kelvin
- Two trigger thresholds
- RS 232 C interface

Typical Applications

- Temperature measurements on cryostats
- Temperature measurements on cryo pumps for monitoring their operation and to control pump systems

Technical Data

Measurement current	μA	10
Display		LED, 5-digits
Temperature range	K	1.4 to 475
Resolution		0.001 K from 1.4 to 99.9 K 0.01 K from 100 to 475 K
Accuracy		±0.05 K from 1.5 to 99.9 K ±0.05 K from 100 to 475 K
Power supply voltage		5 V DC at 1 A through the supplied 100 – 240 V AC power adaptor
Trigger thresholds		2
Switched output		2 relays (n.c. and n.o.) 30 V DC at 1 A
Analog output		
Voltage	V	0 to 10
Current	mA	4 to 20
RS 232 C interface		a) Temperature output b) External adjustment of switching thresholds
Admissible ambient temperature	°C (°F)	+15 to +35 (+59 to +95)
Mechanical design/housing		Benchtop unit
Dimensions (W x H x D)	mm	96 x 48 x 166 (3.78 x 1.89 x 6.54)
Weight (including packaging), approx.		0.45 (1.0)

Low temperature measuring instrument MODEL 211S	844 110
HV cable 2-way with plug, 10 m (35.0 ft) long ¹	844 112
HV cable 4-way with plug, 10 m (35.0 ft) long ²⁾	844 113
UHV cable 4-way with plug, 10 m (35.0 ft) long ²⁾	844 114
Silicon diode, type E, with connecting cable and micro plugs ⁴⁾ without current feedthrough	844000V5
HV current feedthrough on a flange DN 25 KF, 2-way ⁵⁾	E20019256
UHV current feedthrough on a flange DN 16 CF, 4-way ⁶⁾	500 217

¹⁾ Compatible with HV current feedthrough on a flange DN 25 ISO-KF (E20019256) and for older cryo pumps of type RPK.

²⁾ Compatible with current ranges BasicLine (BL) and BL LN₂.

³⁾ Compatible with UHV current feedthrough on a flange DN 16 CF (500217) and cryo pumps from the BL-UHV range.

⁴⁾ Compatible with HV current feedthrough (E20019256).

⁵⁾ Compatible with 844000V5 and measurement line 844112.

⁶⁾ Compatible with measurement line 844114.

Temperature Sensor

Dimensional drawing for the silicon diode, type E

Standard characteristic of the silicon diode

In contrast to vapor pressure thermometers, electric temperature sensors can be used for continuous measurements within a wide range of temperatures.

Silicon diodes offer a negative temperature coefficient of resistance, i.e. their resistance drops as the temperature increases. The slope of the temperature/resistance characteristic and the absolute resistance are decisive regarding the suitability of these diodes. The slope determines the sensitivity of the sensor and a high electrical resistance permits accurate measurements while keeping the thermal load small (microwatts).

In systems which are degassed at high temperatures, silicon diodes can only be fitted after degassing has been completed.

The silicon diode type E matches the low temperature display unit.

Technical Data

Silicon Diode Type E

Temperature range	K	1.4 to 325
Temperature coefficient (dR/dT)		
qualitative		Negative in the entire temperature range
quantitative	Ω/K	Non-linear characteristic
Measurement current	μA	10
Bakeable to	°C (°F)	+60 (+140)
